                                                                                              The present sequence represents a His-tagged Nef-Tat linked protein of HIV, with a lipidation signal sequence (LipoD) which is removed after processing and a ProtD fusion partner. The protein is expressed in Escherichia coli, and is used to produce the vaccine of the invention. The specification describes the use of HIV Tat, HIV Nef, or Nef-Tat; and HIV 9p120 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with 9p120 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of Colf+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat

                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a His-tagged ProtD-Nef-Tat fusion protein. The protein is expressed in Escherichia coli, and is used to produce the vaccine of the invention. The specification describes the use of HIV Pat, HIV Nef, or Nef-Tat; and HIV 9p120 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with gp120 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat and HIV gp120.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   121

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a fusion protein comprising Lipo Tat.His. The protein is exemplifies the fusion proteins of the invention. The specification also describes fusion proteins comprising HIV-1 Nef protein. The fusion protein can be used in vaccine to prevent HIV infection.

The protein is exemplifies the fusion proteins of the invention. The specification also describes fusion proteins comprising HIV-1 Tat protein. The fusion protein can be used in a vaccine to prevent HIV infection.

```
The present sequence represents a His-tagged Nef protein of HIV, with a lipidation signal sequence (LipoD) which is removed after processing. The protein is expressed in Escherichia coli, and is used to produce the vaccine of the invention. The specification describes the use of HIV Tat. HIV Nef. or Nef-Tat: and HIV gpl20 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with gpl20 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat and HIV gpl20.

The protein is exemplifies the fusion proteins of the invention. The specification also describes fusion proteins comprising HIV-1 Tat protein. The fusion protein can be used in a vaccine to prevent HIV infection.

                                                                                  The present sequence represents a His-tagged ProtD-Nef fusion protein. The protein is expressed in Escherichia coli, and is used to produce the vaccine of the invention. The specification describes the use of HIV Tat, Nef, or Nef-Tat; and HIV gpl20 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with gpl20 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV, Tat, Nef or Nef-Tat and HIV gpl20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               241

The present sequence represents a representative HIV-1 Nef-Tat-His protein. The protein is used in the creation of the Guslon proteins of the invention, in conjunction with a fusion partner (e.g. protein D). The fusion protein can be used in a vaccine to prevent HIV infection.

The present sequence represents a representative HIV-1 mutant Tat-His protein. The protein is used in the creation of the fusion proteins of the invention, in conjunction with a fusion partner (e.g. protein D). The specification also describes fusion proteins comprising HIV-1 Nef protein. The fusion protein can be used in a vaccine to prevent HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              121 fpdwqnytpgpgvrypltfgwcyklvpvepdkveeankgentsllhpvslhgmddperev 180

                                                                                                                                                                                                                                                                                                           The present sequence represents a His-tagged Nef-Tat linked protein of HIV. The protein is expressed in the yeast Pichia pastoris, and is used to produce the vaccine of the invention. The specification describes the use of HIV Tat. HIV Nef, or Nef-Tat; and HIV gpl20 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutic immunization of humans against HIV. Tat. Nef or Nef-Tat act in synergy with gpl20 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat. Nef or Nef-Tat and HIV gpl20.

                                                                                                                                                                                                                                                         The present sequence represents a His-tagged mutant His protein of HIV. The protein is expressed in the yeast Pichia pastoris, and is used to produce the vaccine of the invention. The specification describes the use of HIV Pat, HIV Nef, or Nef-Tat; and HIV gpl20 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with gpl20 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat and HIV gpl20.

```
present sequence represents a representative HIV-1 Nef-His protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The protein is used in the creation of the fusion proteins of the invention, in conjunction with a fusion partner (e.g. protein D). The specification also describes fusion proteins comprising HIV-1 Tat protein. The fusion protein can be used in a vaccine to prevent HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              289

This invention describes novel binding partners (A) (1) for negative factor protein (Nef) that competitively inhibit binding of calmodulin (I) to Nef, or (11) for (I) that competitively inhibit binding of Nef to (I). (A) are used for prevention, diagnosis (by specific detection of intraand/or extra-cellular Nef, including staging of infection), and/or treatment of infections with human immune deficiency virus (HIV). 110 MGGKWSKSSVVGWPTVRERMRRAEPAADGVGAASRDLEKHGAITSSNTAATNAACAWLEA 169 Binding agents used for treatment, prevention and diagnosis of human immune deficiency virus infection NEF protein; calmodulin; negative factor protein; binding inhibitor; diagnosis; detection; infection; treatment; HIV. **QEEEEVGFPVTPQVPLRPMTYKAAVDLSHFLKEKGGLEGLIHSQRRQDILDLWIYHTQGY** DB 21; Length 206; Score 1120; DB 21; Pred. The protein is expressed in the yeast Pichia pastoris, and is used to produce the vaccine of the invention. The specification describes the use of HIV Tat, HIV Nef, or Nef-Tat; and HIV gpl20 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act. In synergy with gpl20 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat and HIV gpl20. This invention describes a novel retroviral packing cell (I), comprising the retroviral genes gag, pol and glycoproteins GP-1 and GP-2 of the LCMV coding gene gp, or a part of these. The products of the invention have anti-HIV and cytostatic activity and con be used for gene therapy. (I) is useful for in vitro infection of cells, especially hematopoletic stem cells, for expression of transgenes in cells and as a pharmaceutical carrier for gene therapy. (I) is therefore useful in the treatment of infectious diseases (HIV or AIDS), neoplasms (carcinomas), melanomas and other diseases. This sequence represents the Human immunodeficiency virus (HIV-1) nef protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New retroviral packing cell useful as pharmaceutical carrier in gene therapy for treatment of HIV and neoplasms, comprises retroviral genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  110 MGGKWSKSSVVGWPTVRERMRRAEPAADGVGAASRDLEKHGAITSSNTAATNAACAWLEA 169

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The nef protein comprises peptides which are expressed in vivo in HIV infected patients before detectable amts. of p25, gpl10 and gp41 are expressed. Thus, they can be used in assays for early detection of HIV. They can also be used to raise antibodies for use in detection, to induce cellular immunity or to raise neutralising antibodies that either inactivate the AIDS virus or reduce the viability of the virus in vivo or destroy infected cells. The peptides may be used in viral vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                110 MGGKWSKSSVVGWPTVRERMRRAEPAADGVGAASRDLEKHGAITSSNTAATNAACAWLEA 169

A comparison of AAN60287 with the cDNA of the HTLV-III genome revealed one particular clone, designated p7.11 which contained a DNA sequence encoding this peptide (AAP60308) sequence. This approx 2.2 kilobase covers the precursor gay region and encodes, 5' to 3', p-12, p-15, p-24 a second p-15 protein, and approx. 300 extra base pairs 3' to the gay region (see AAN60288).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  110 MGGKWSKSSVVGWPTVRERMRRAEPAADGVGAASRDLEKHGAITSSNTAATNAACAWLEA 169

This invention describes a novel fusion polypeptide which comprises (a) a first polypeptide sequence of an AIDS associated E', env, or gag polypeptide, that specifically binds complementary antibody and (b) a second polypeptide sequence which is not an AIDS associated virus polypeptide. Also described are are (1) a fusion polypeptide having a herpes simplex virus (HSV) gD signal peptide sequence fused in reading frame with a polypeptide sequence other than HSV gD, (2) a nucleic acid encoding a fusion polypeptide as in (1); (3) an expression vector comprising a nucleic acid as in (2); (4) a host comprising a vector as in (3). The AIDS-associated fusion polypeptides can be used in the detection of and vaccination against viral etiological agents of AIDS. They can also be administered as a pharmaceutical agent to inhibit infection by AIDS associated retrovirus or dissemination of such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         QEBEEVGFPVTPQVPLRPMTYRAAVDLSHFLKEKGGLEGLIHSQRRQDILDLWIYHTQGY 229

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The inventors claim a polypeptide which is recognised by sera of human origin contg. antibodies against the virus of lymphadenopathies (LAV) or acquired immune deficiency syndrome (AIDS). Also claimed are various peptides corresp. to the AA sequences deducible from proteins encoded by LAV DNA, defined by specific residues (e.g. 12-32, 37-46, 49-79, 88-153) in accordance with a formula given in the specification.

The Nef protein or its derivative is expressed and generates an immune response which provides a substantial level of protection against HIV infection, upon administration of to a host. The DNA vaccine is useful contained and a negative is esponse against infection or disease caused by virulent strains of HIV, response against infection or disease caused by virulent strains of HIV, referably human. It is also useful for lowering transmission rate to previously uninfected individual, so as to prolong the asymptomatic phase of HIV infection. The present sequence is human immunodeficiency virus-1 (HIV-1) Jifl Nef protein. The different codon optimised nef constructs of the invention are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel DNA vaccine useful for inducing cell mediated immune response against virulent strains of HIV, comprises DNA expression vector, and DNA containing codon optimized open reading frame encoding Nef protein

This sequence represents a protein of unspecified function contained in a complete nuclectide sequence of ARV-2 derived from partial sequences of several ARV clones. The invention provides a method for construction of a vector for expression of a polypeptide in a mammalian cell, comprising a polypeptide coding sequence operably linked downstream of an enhanced promoter. The enhanced promoter comprises the human cytomegalovirus immediate early region (HCMV IEL) promoter. The polypeptide can be any of the to the 3' end of the HCMV IEL promoter. The polypeptide can be any of the HIV recombinant polypeptides and especially HIV gpl20. Expression of HIV gpl20 by COS 7 cells transfected with pcWVea containing the above enhanced promoter,

given in AA290201). The immunogenic pol fragment is not immunologically cross reactive with human T cell lymphotropic viruses I or II. The invention also encompasses the used of p31 as an antigen. The recombinant antigens may be produced in Escherichia coll, Saccharomyces cerevisiae or in mammalian cells. Immunoassays using the recombinant HIV proteins may be used to diagnose and stage HIV-1 infections. Sequences
AAY77284-Y77299 represent proteins encoded by the genome of HIV-1 (ATCC

                                                                                                                                                             expression vector, and a DNA molecule containing a codon optimised open reading frame encoding a Nef protein or its immunogenic derivative. The Nef protein or its expressed and generates an immune response which provides a substantial level of protection against HIV infection, upon administration of to a host. The DNA vaccine is useful for inducing a cell mediated immune (vytotoxic T lymphocyte, CTL) response against infection or disease caused by virulent strains of HIV, by administering the DNA vaccine into the tissue of the vertebrate host, preferably human. It is also useful for lowering transmission rate to previously uninfected individuals and/or for reducing levels of viral loads within an infected individual, so as to prolong the asymptomatic phase of the invention are used in the exemplification of the
Novel DNA vaccine useful for inducing cell mediated immune response against virulent strains of HIV, comprises DNA expression vector, and DNA containing codon optimized open reading frame encoding Nef protein

This sequence constitutes the ORF P protein constituent of a new strain of HTV-1 retrovirus, OYI. This mutant retroviral strain is useful in an assay for diagnosing HIV infection. See also AAQ11943 (OYI nucleotide sequence), AAR12255-61 (other HIV OYI constituent

human retrovirus - is mutant of HIV-1 having istics of HIV-1 OYI, used in diagnosis of HIV infection

                                                                                                                                                                                                                                                                     The present invention relates to a DNA vaccine comprising a DNA expression vector, and a DNA molecule containing a codon optimised open reading frame encoding a Nef protein or its immunogenic derivative. The Nef protein or its derivative is expressed and generates an immune response which provides a substantial level of protection against HIV infection, upon administration of to a host. The DNA vaccine is useful for inducing a cell mediated immune (cytotoxic T lymphocyte, CTL) response against infection or disease caused by virulent strains of HIV, by administering the DNA vaccine into the tissue of the vertebrate host, by administering the DNA vaccine into the tissue of the vertebrate host, by administering the DNA vaccine into the tissue of the vertebrate host, by administering the DNA vaccine into the tissue of the vertebrate host, corrected individual, so as to prolong the asymptomatic condition. The present sequence is human tissue plasminogen activator (HPA) leader peptide-human immunodeficiency virus-1 (HIV-1) if IN Nef (opt tpanef) chimeric multant protein. The mutation include deletion of the myristylation site (Gly2) in the HIV-1 jifil Nef protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ï
                                                                                                                                          Novel DNA vaccine useful for inducing cell mediated immune response against virulent strains of HIV, comprises DNA expression vector, and DNA containing codon optimized open reading frame encoding Nef protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA vaccine; codon optimisation; Nef protein; HIV infection; anti-HIV; cell mediated immune response; cytotoxic T lymphocyte; CTL; human immunodeficiency vitus-1; HIV-1; human; jrfl nef; opt tpanef; tissue plasminogen activator; tPA; chimeric protein; mutant; mutein.

loads within an infected individual, so as to prolong the asymptomatic phase of HIV infection. The present sequence is human tissue plasminogen activator (tPA) leader peptide-human immunodeficiency virus-1 (HIV-1) if Nef (LLAA) chimeric mutant protein. The different codon optimised nef constructs of the invention are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a DNA vaccine comprising a DNA reading frame encoding a New Procession vector, and a DNA molecule containing a codon optimised open reading frame encoding a Nef protein or its immunogenic derivative. The Nef protein or its derivative is expressed and generates an immune response which provides a substantial level of protection against HIV infection, upon administration of to a host. The DNA vaccine is useful for inducing a cell mediated immune (cyctoxic T lymphocyte, CTL) response against infection or disease caused by virulent strains of HIV, by administering the DNA vaccine into the tissue of the vertebrate host, preferably human. It is also useful for lowering transmission rate to previously uninfected individuals and/or for reducing levels of viral
                                                                                                                                                                                                                                                                     /note- "Wild type dileucine motif (Leu-Leu) substituted with Ala-Ala"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel DNA vaccine useful for inducing cell mediated immune response against virulent strains of HIV, comprises DNA expression vector, and DNA containing codon optimized open reading frame encoding Nef protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present in invention provides the protein and coding sequences for a number of human immunodeficiency virus (HIV) type 1 non-subtype B isolates. The sequences shown include the near full-length coding sequences from each isolate, and the env, pol, viz, vpr, vpu, agg, tat, rev and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies against non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   QEEEEVGFPVTPQVPLRPMTYKAAVDLSHFLKEKGGLEGLIHSQRRQDILDLWIYHTQGY 229

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immunodeficiency virus type isubtype C/B' which can be used for the induction of specific humoral and cellular immune responses. (1) and pulpapelides (II) encoded by them, are useful in pharmaceuticals, vaccines and diagnostic agents, particularly for treatment or prevention of human immune deficiency virus-1 (HIV-1) infections, also for rational design of test or therapeutic reagents, or gene therapy vectors. Polypeptides, especially antibodies, specifically directed against (II) are similarly useful as pharmaceutical and diagnostic agents. (I) are specific for intersubtype C/B' of HIV-1 so are useful in regions specific for intersubtype C/B' of HIV-1 so are useful in regions. The products of the invention have antiviral activity. This sequence represents a procein encoded by the HIV-1 subtype C genome described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2723 mggkwskssivgwpairermrrtepaadgvgavsrdlekhgaitssntaatnedcawlea 2782

                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                           2255

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    protein -
